MLOPS:

ML: retrospective dataset → Input → AI Model → Output

Inference

retrospective dataset for training:

Improve the quality of predictions

Pre-training:

* Preprocessing
* Pretraining
* Data bias estimation

Training:

* Optimization problem
* In-processing Bias estimation
* ⋮

Post training:

* Silent trial
* Deployment
* Monitoring

Ex: 2000 Dog / cats

70% → Train → Model training: output: ML Model

17% → Val → Finetuning of hyperparameters

Random forest: # trees, max_depth, type of tree

	10	2	
Perf. Val.set	50	10	Perf3. Val
	100	20	
(10,2,-)	(10,10,-)	(10,20,-)	(50,2,-) (50,...)

12% → Test → Estimate realtime perf.

10/11 student per groupe:

*project 1:

- Client churn estimation dataset

ML → Jupyter notebook

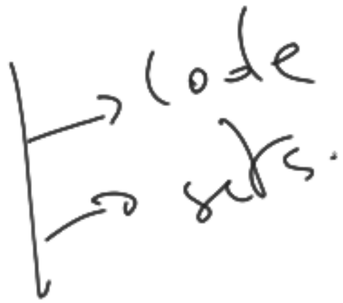

OPS → Code refactoring
→ Deployment

Group structure:

(3) ML student —
(2-3) OPS —
1= 2 server Managent —
2-3 Monitoring +

* VPS
* ML servers:
* dataset sharing

→ git / github / gitLab - ——

DVC
